

Large scale emergency situations, whether natural disasters or person generated events, are a factor of modern life.

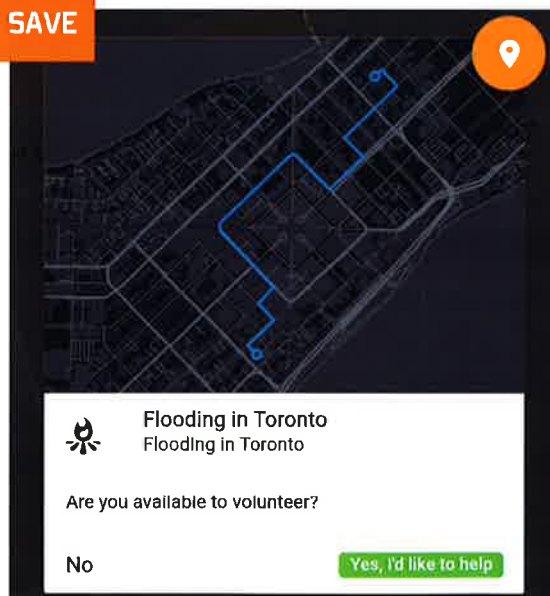

Vulnerable populations, such as people with limited mobility or medical conditions, may need help in a disaster but do not require 911 and first responders. These populations are growing as health care delivery is increasingly decentralized.

SAVE provides a proactive technology which identifies vulnerable persons location/need and activates community volunteers.

We count on them to provide services (eg. driving) or resources (eg. portable generator).

When the Emergency Operations Centre requires our volunteers to come into action, they will have access to the information on SAVE.

This will give the EOC the ability to match a volunteer with a vulnerable person and get confirmation when this specific situation is under control.

SAVE can help you SAVE your community
